### DCA Conversion for PC-Write®

PC-Write, the popular word processor for the IBM PC and compatibles, now has a package for DCA file conversion. DCA, or Document Content Architecture, is a *language* designed to *define* formatted documents. It is broad enough in its scope to define virtually any formatted document.

PC-Write's DCA Conversion package allows document files to be transferred between PC-Write and other major word processors that support the DCA-RFT format. Files can also be converted between PC-Write and IBM mainframes. The key benefit of DCA is that documents can be converted between systems without losing their formatting descriptions.

PC-Write is increasingly popular in large organizations. This new DCA conversion program addresses the need for schools and businesses to "standardize" word processing files and transfer these files between different systems. PC-Write uses straight ASCII files. The DCA conversion program converts these files into EBCDIC files in the DCA-RFT format. These EBCDIC files are compatible with IBM DISOSS (Distributed Office Support System).

The DCA Conversion program, like PC-Write itself, is shareware; it may be copied and given to others for evaluation before purchasing. The program comes with a printed DCA Conversion Guide. The Guide describes operational steps and provides extensive background information on DCA-RFT architecture. The complete DCA package, software and Guide, costs \$29. Separately, the software costs \$10 and the Guide costs \$20. Orders may be placed with Quicksoft, Inc., at 219 First N. #224, Seattle, WA 98109, (800) 888-8088 or (206) 282-0452.
